

New initiatives for Severe Weather prediction at ECMWF

Tim Hewson,

Ivan Tsonevsky, Fernando Prates, Richard Forbes

ECMWF

Layout

● 1. EFI-related developments:

- Upgraded Model Climate (M-Climate)
- Extended lead times
- New method of computation
- EFI for CAPE

● 2. Diagnosis of Freezing Rain

- Changes to model physics
- Precipitation type product

● 3. New Diagnostics

- Visibility
- Precipitation rate / type

● 4. Tropical cyclone tracks

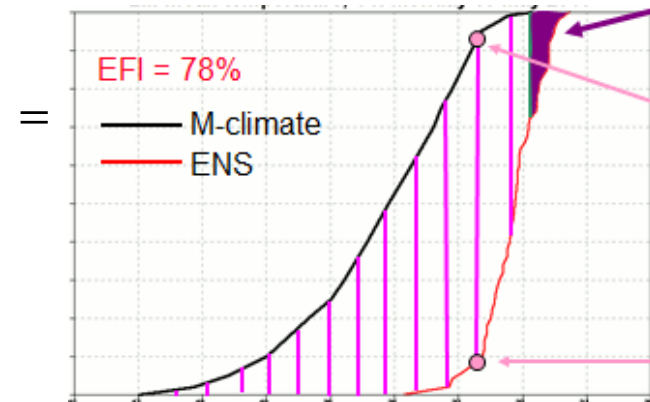

- Extension to day 10, BUFR products for genesis events

● 5. ecCharts - New Convective Indices

All developments to be described relate to user requests and feedback over recent years, and to ECMWF strategy in which improved prediction of severe weather is a key goal

1. EFI-related developments

First Aim

- To have more stable, more accurate values for the EFI and SOT (“Extreme Forecast Index” and “Shift Of Tails”)
- Recall that EFI & SOT depend on the difference between the forecast pdf (or cdf) and the M-climate pdf (or cdf), *which is a function of lead time*
- EFI and SOT sometimes behave erratically, not because of changes in the forecast, but because of sampling-related changes in M-Climature at different lead times. **So we need better sampling, i.e. more cases.**
- It is particularly important to define the M-Climature tails, as EFI and SOT are particularly sensitive to these
- The problem is that the EFI can reduce or increase between one forecast and the next *without* the new forecast being any different...
- (any drifts in model forecast parameters need also to be captured, but except for tropical rainfall these drifts are generally small)
- Enhanced computer power will allow us to increase the number of realisations for the M-climate by a factor of ~4..

EFI Model climate

- **NOW: Operational M-climate:**

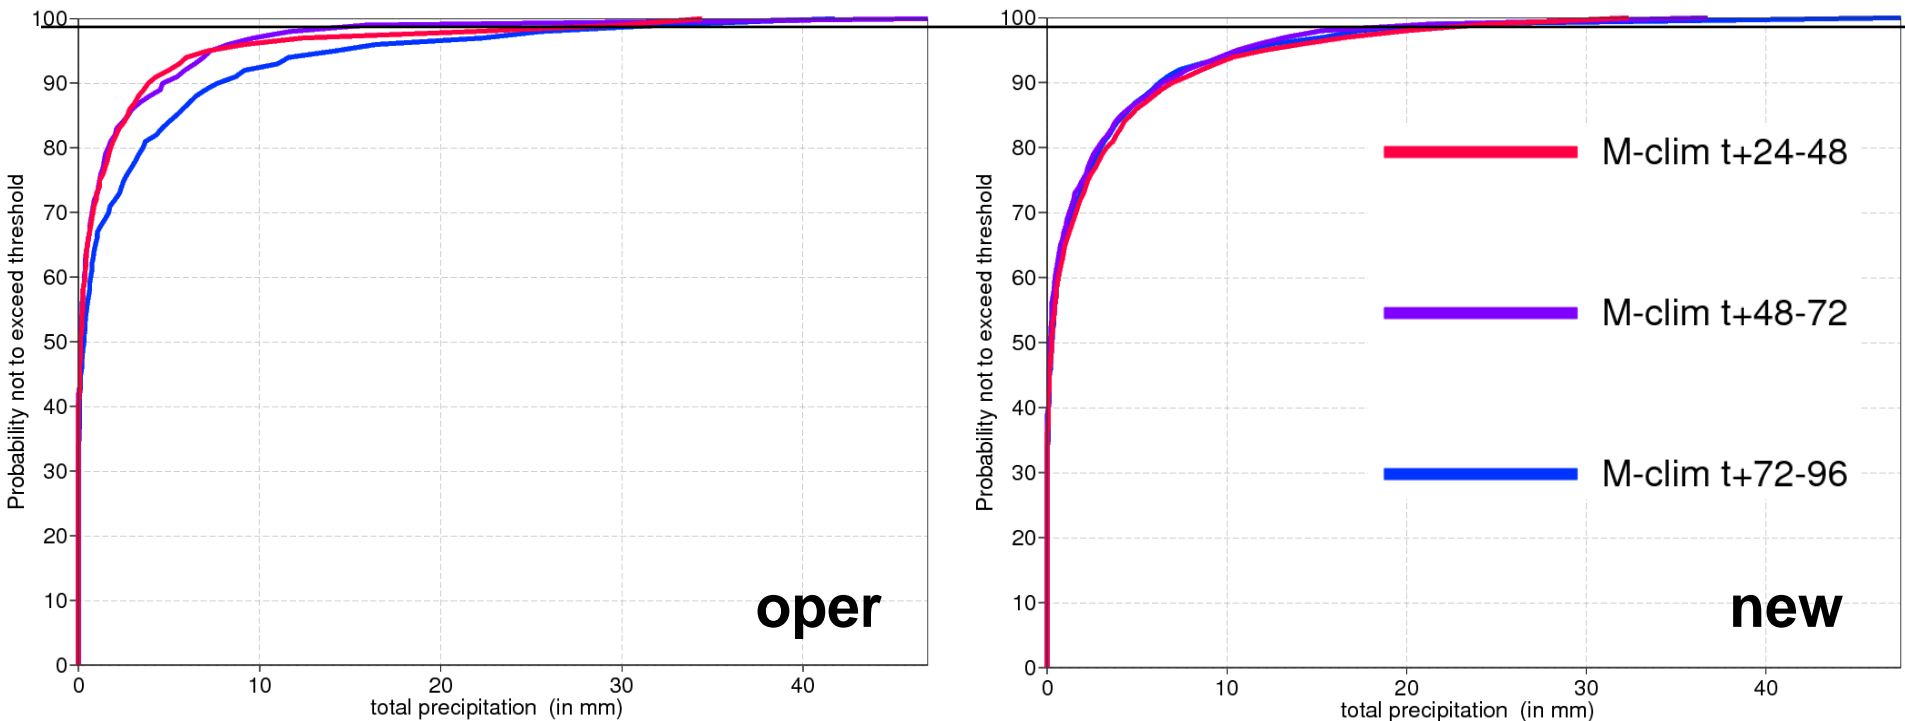

- 5-member ensemble with model version in operations, re-forecasts 20 years back
- Once a week – every Thursday
- 5 re-forecast runs centred on the week of interest (5 weeks in total)
- Sample size: **500 values** (5 members X 20 years X 5 start dates)

- **FUTURE: New M-climate:**

- 11-member ensemble, 20 years
- Twice a week – every Monday and Thursday
- 9 re-forecast runs centred on the week of interest (5 weeks in total)
- Sample size: **1980 values** (11 members X 20 years X 9 start dates)

CDFs, M-climate, total precipitation, example at one location:

Lat: 48.2, Lon: 18.0

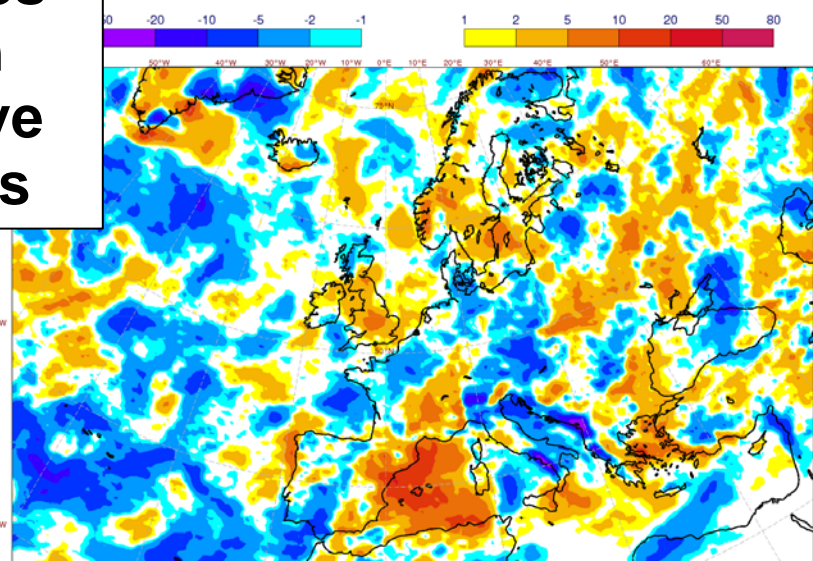

- **Less noisy tails with the new M-climate**

15/05/2014 Operational EFI model climate Q99 for total precipitation (in mm) T+48-72

15/05/2014 Operational EFI model climate Q99 for total precipitation (in mm) T+72-96

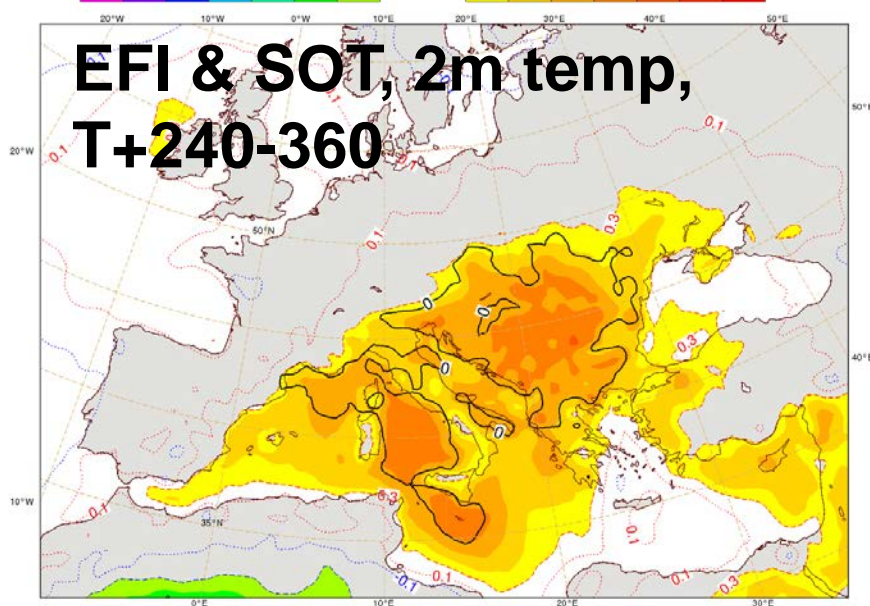

Second Aim

- **To extend EFI-related guidance beyond day 10**
- **Potential to provide pointers to potential severe weather even further in advance**
- **Often the signals are very small at these ranges, but not always...**
- **Generally we need to use lower thresholds for shading/contouring (for EFI, but not for SOT)**
- **Examples follow..**

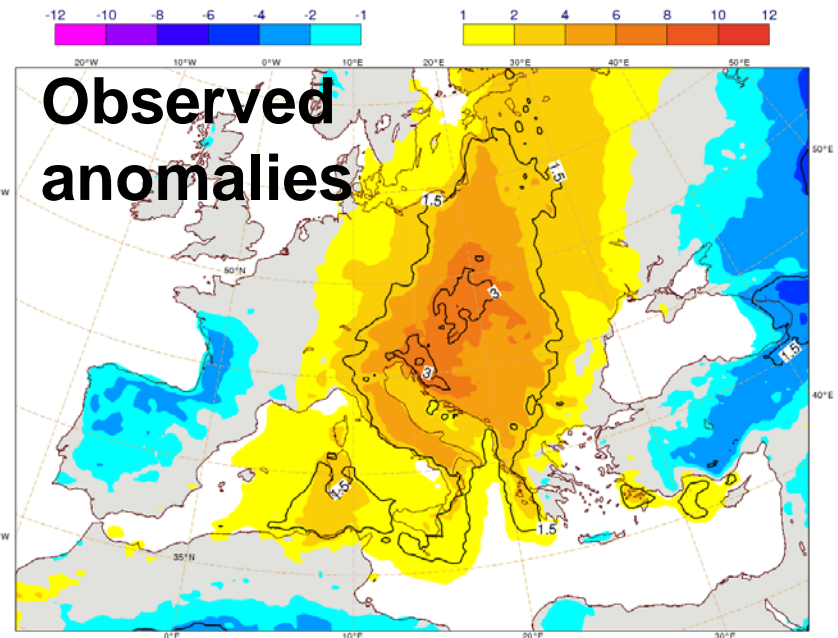

EFI & SOT for temperature, T+240-360h

Fri 26 Jul 2013 00UTC @ECMWF VT: Mon 05 Aug 2013 00UTC - Sat 10 Aug 2013 00UTC 240-360h
Extreme forecast index and Shift of Tails (black contours 0,1,5,10,15) for: 2m mean temperature

**EFI & SOT, 2m temp,
T+240-360**

2-metre mean temperature anomalies VT: 05/08/2013 00UTC - 10/08/2013 00UTC

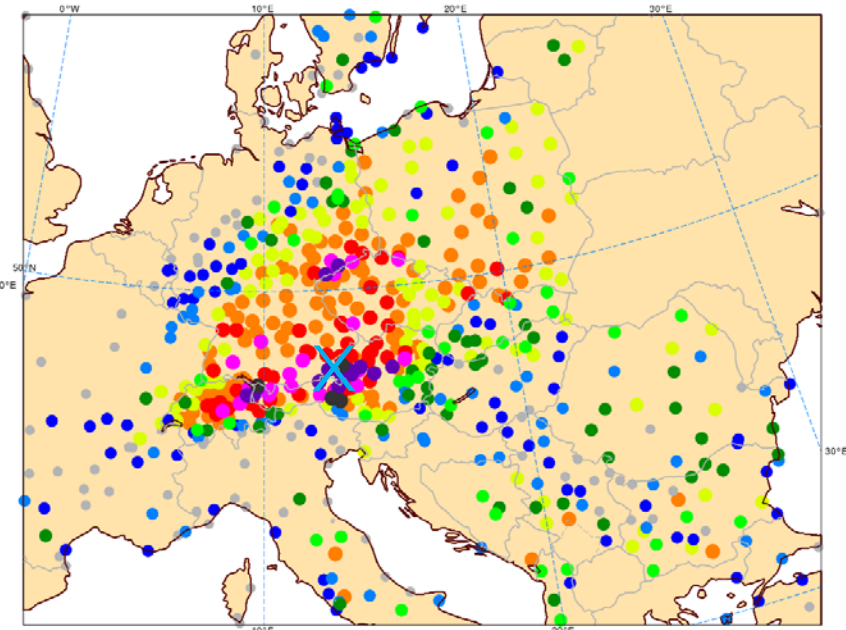

**Observed
anomalies**

- A heatwave affected many countries from the Mediterranean northwards to Scandinavia in **early August 2013**. Austria set a new high temperature record when temperatures in two locations in eastern Austria exceeded 40°C on 8th August.
- EFI gave an early signal of the likelihood of exceptionally hot weather .

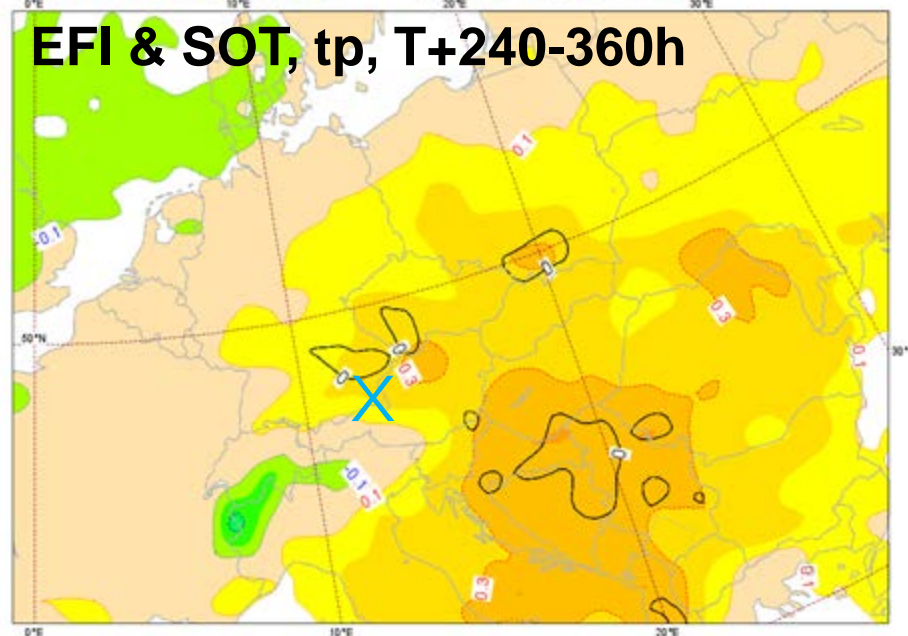

EFI & SOT for total precipitation, T+240-360h

Observed total rainfall

from 31/05/2013 00UTC to 05/06/2013 00UTC

Tue 21 May 2013 00UTC @ECMWF VT: Fri 31 May 2013 00UTC - Wed 05 Jun 2013 00UTC 240-360h
Extreme forecast index and Shift of Tails (black contours 0,1,5,10,15) for: total precipitation

EFI & SOT, tp, T+240-360h

- Several days of heavy rain led to severe flooding in Central Europe at the end of May and beginning of **June 2013**.
- An early signal of extreme precipitation appeared in the EFI and SOT forecast for T+240-360 lead time.

Third Aim

- **Improve integrity of computations**

- (1) Dispense with using M-climate over periods from 12UTC to 12UTC (can cause EFI jumpiness in e.g. maximum temperature due to double counting, particularly around 40°E)
- (2) Better mathematical treatment of the EFI integral

- **Illustrate (2) with a recent heatwave example...**

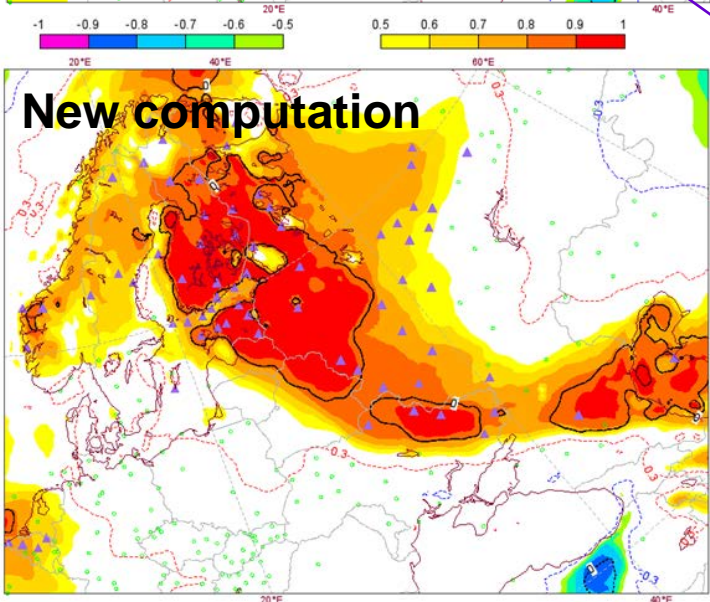

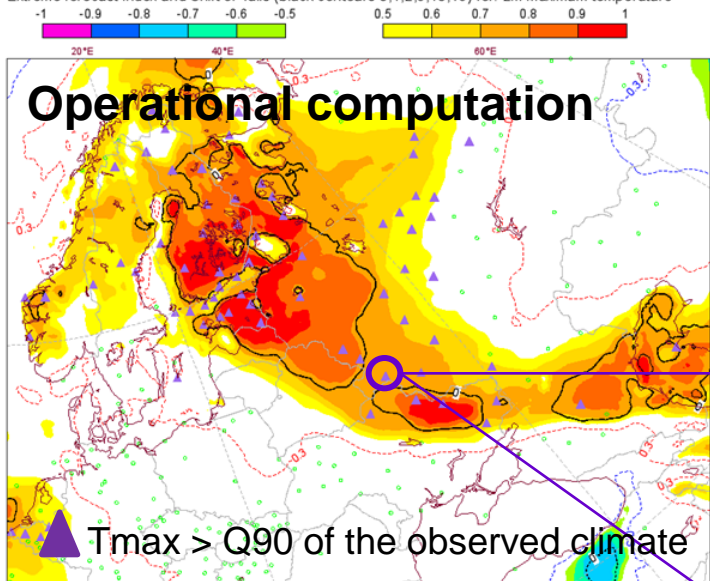

- **Impact on verification scores needs to be tested**

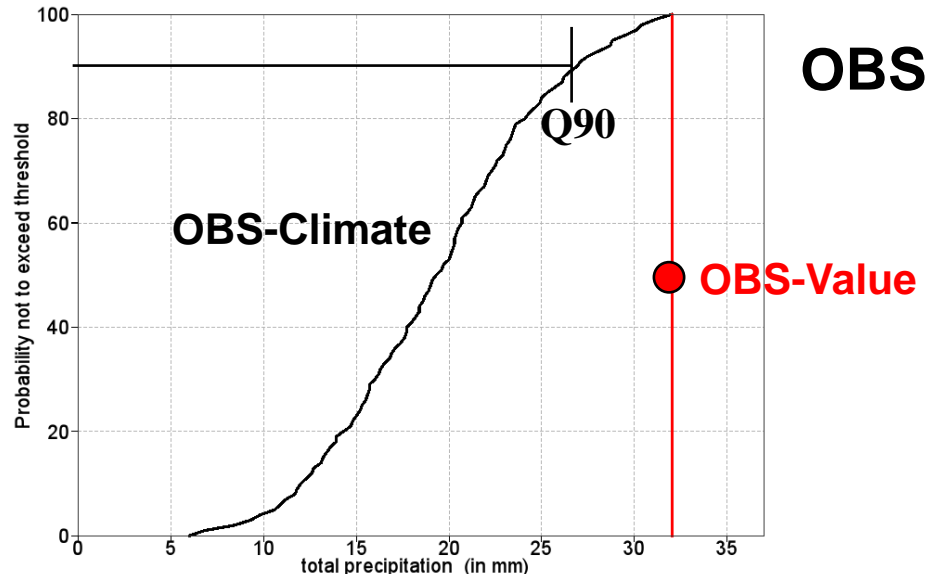

Thanks to
Michail Diamantakis

New computation for the EFI

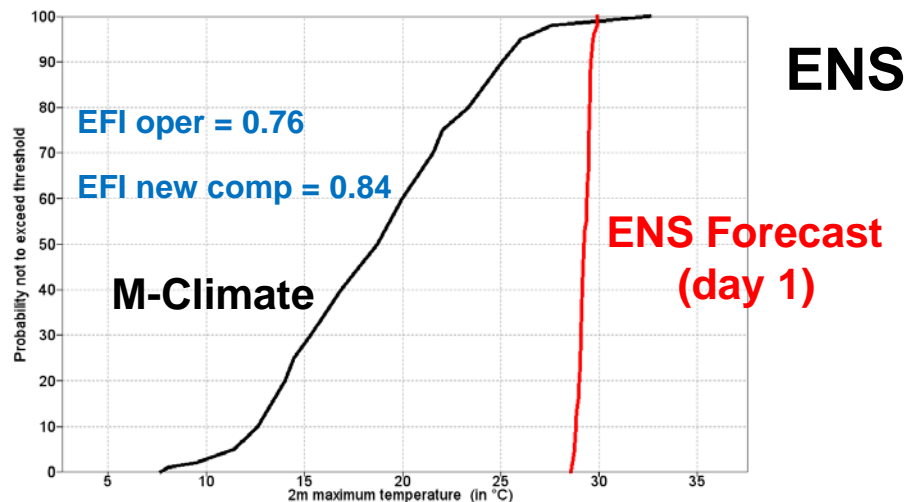

Mon 19 May 2014 00UTC @ECMWF expver = 1 VT: Mon 19 May 2014 00UTC - Tue 20 May 2014 00UTC 0-24h
 Extreme forecast index and Shift of Tails (black contours 0, 1, 2.5, 10, 15) for: 2m maximum temperature

Cumulative Distribution Functions for total precipitation at 52.58°/33.77° VT: 19/05/2014
 Station: 26997, CLIM MIN: 6; CLIM MAX: 32

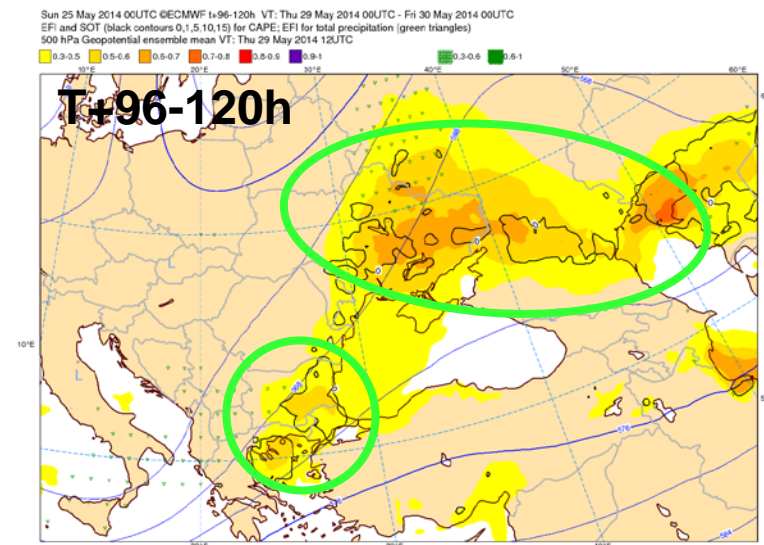

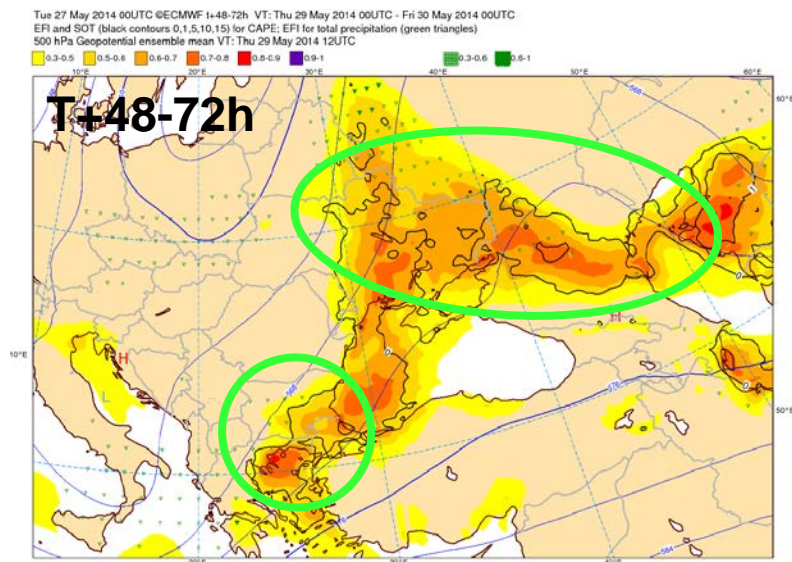

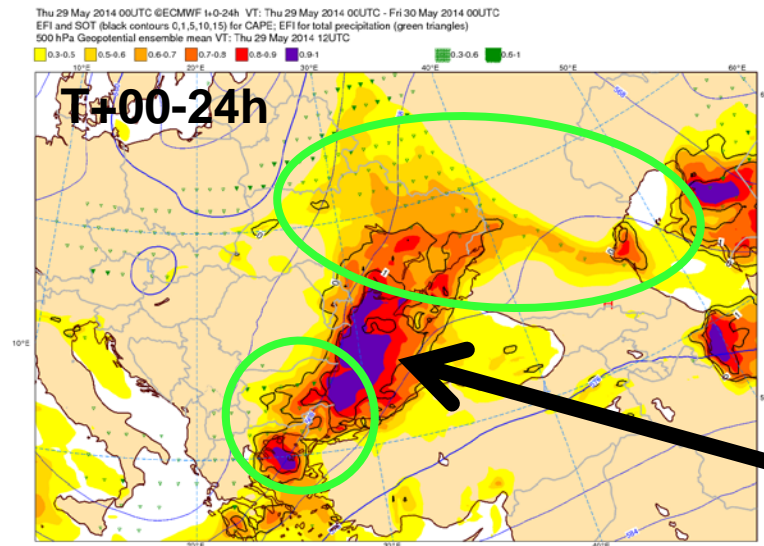

Monday 19 May 2014 00UTC @ECMWF I+00-24 VT: 19-05-2014 00UTC - 20-05-2014 00UTC
 expver = 1; Cumulative Distribution Functions for 2m maximum temperature at 52.58°/33.77°

Fourth Aim

- **Introduce new variables, following user requests, to assist with predicting hazards related to vigorous convection**
- **EFI and SOT for CAPE**
- **Note that as with all EFI-type parameters this gives only a relative measure of the potential severity of any convective activity (for a given location at a given time of year).**
- **Caution is required to not “over interpret” – more so than with other EFI parameters.**

Severe convection, 29/05/2014, CAPE EFI/SOT

2. Diagnosis of Freezing Rain

Freezing rain, Slovenia, beginning of Feb 2014

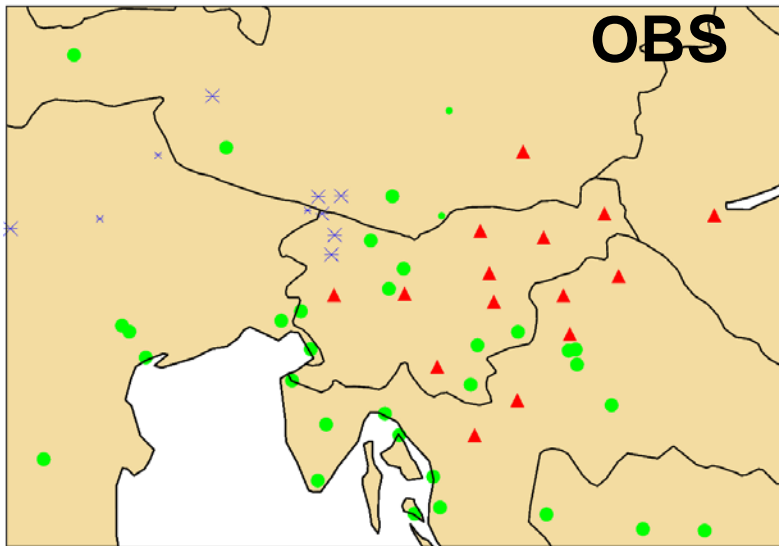

- An ice storm damaged forests and power lines in Slovenia at the beginning of February 2014.
- The Slovenian government said that more than 40% of the Alpine forests had been damaged.
- One in four homes in Slovenia left without electricity.

Photos are from Postojna, SW Slovenia on 3rd February 2014

2nd Feb 2014 12UTC

Sunday 02 February 2014 00 UTC; ECMWF HRES Precipitation Type VT: Sunday 02 February 2014 12 UTC

● drizzle ● rain ▲ freezing rain ◆ snow and rain ◆ ice pellets ✕ snow

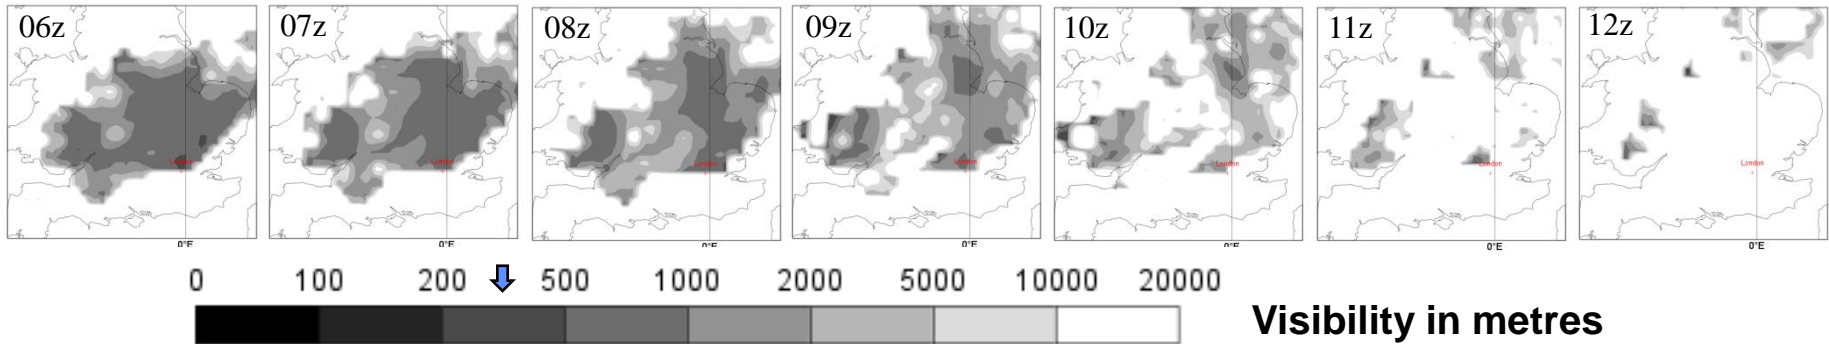

Two related ECMWF developments:

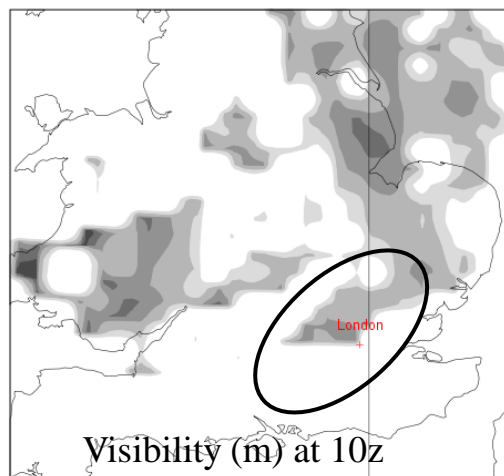

- New precip type/rate diagnosis/diagnostics
- Model physics changes to markedly slow down the re-freezing of melted precipitation
- Next – ENS freezing rain probability...

3. New Diagnostics

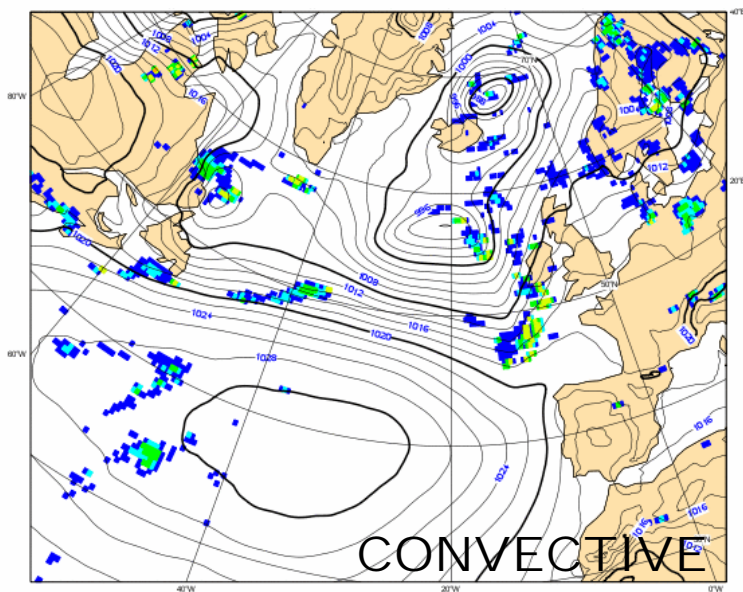

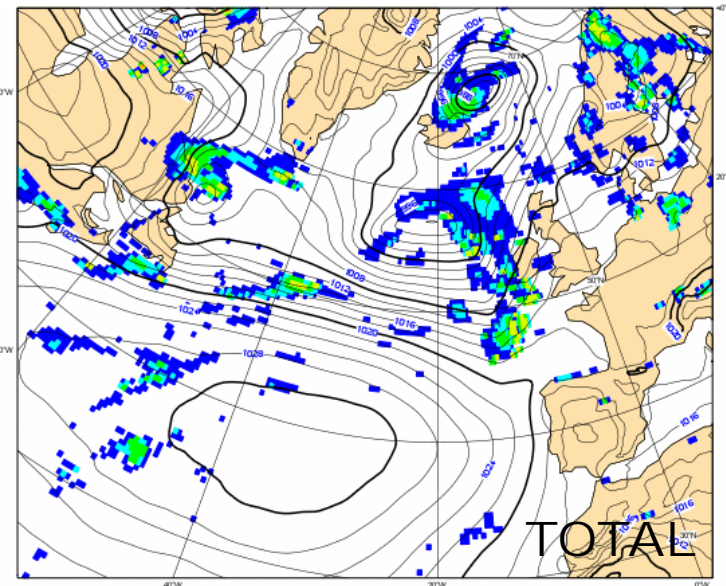

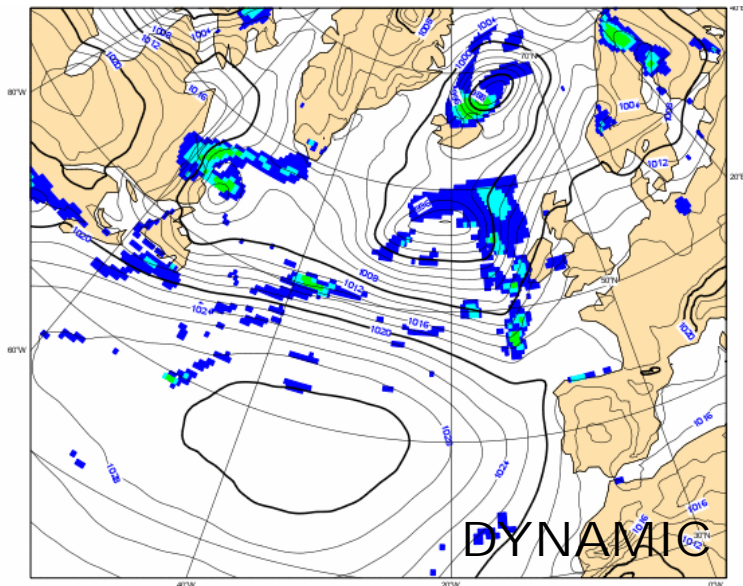

Visibility/Fog - Case study: UK 11 Dec 2013, HRES 12 hour forecast

MODIS visible at ~10z

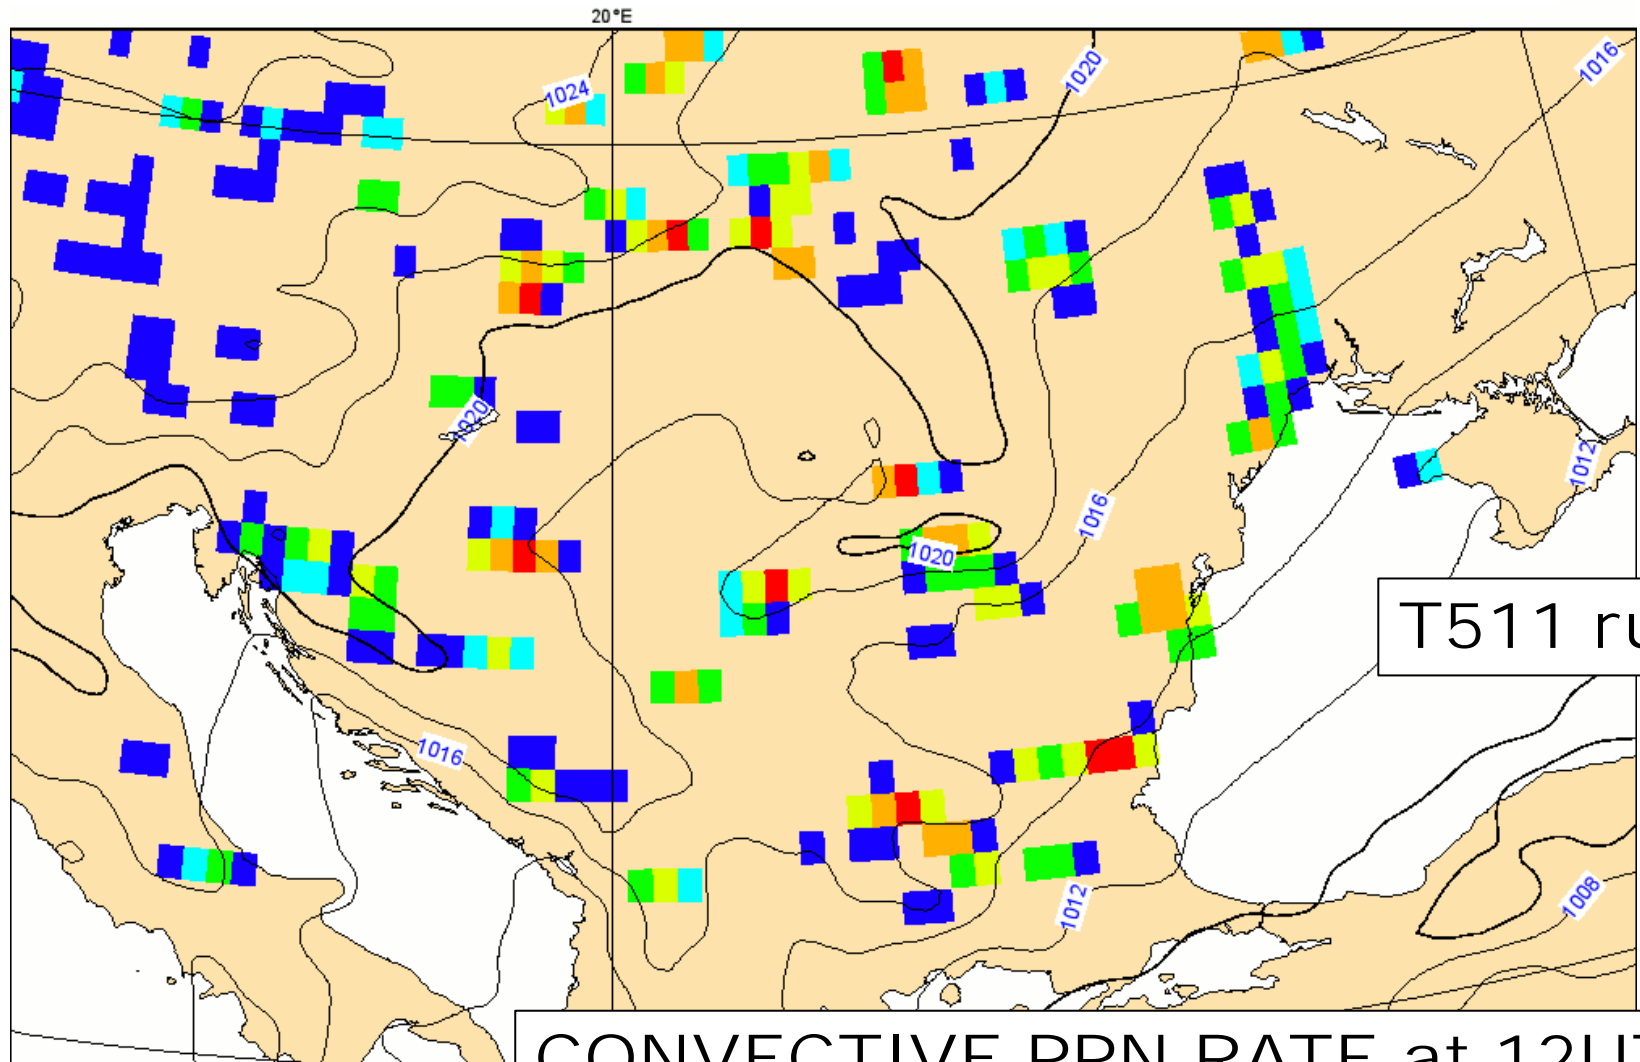

- Visibility is a new diagnostic for the next model version (primarily for fog/precip)
- For this case, observed fog in London (+elsewhere) overnight.
- IFS gives indication of low visibilities in generally the right area, and dissipates fog through the morning.
- Diagnostic most useful in probabilistic mode

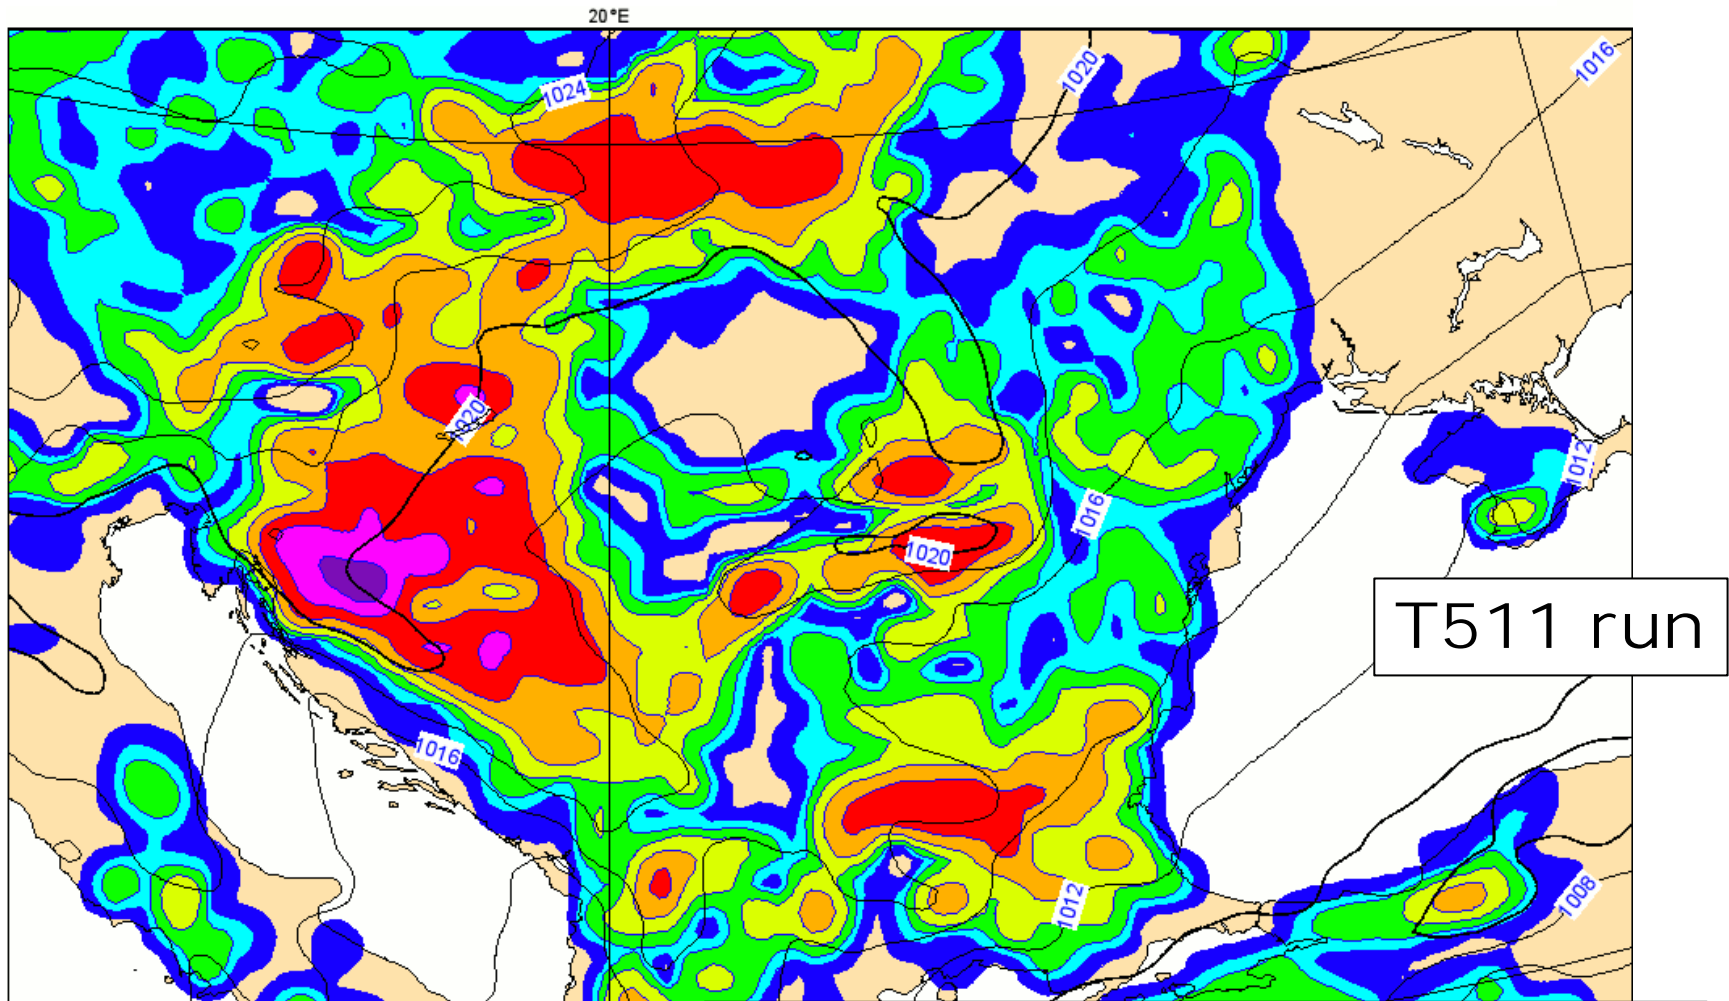

Precipitation rates

- Example run (at T511) from July 2013
- Output looks sensible
- For dynamic ppn that should be a given, for convective there could have been issues
- Maximum convective rate in this domain = 8-16mm/hr

T511 run

CONVECTIVE PPN RATE at 12UTC

24h TOTAL PRECIPITATION

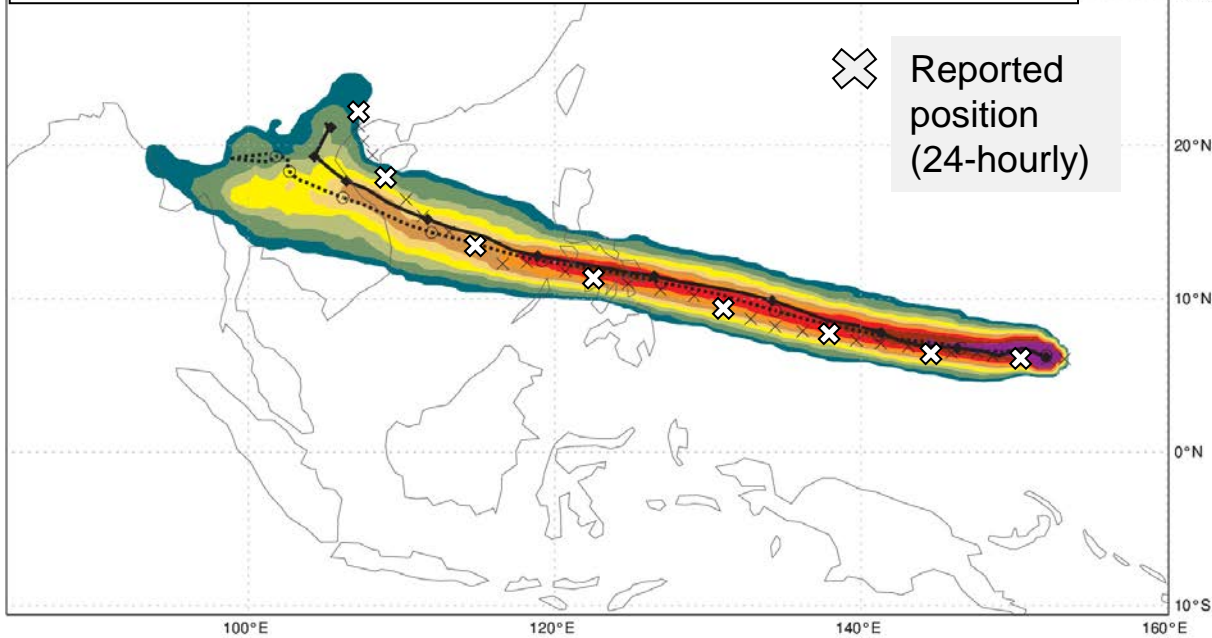

Precipitation Type

- As already illustrated...
- Plot to right shows Dec 2013 Toronto case

4. Tropical cyclone tracks

Date 20131104 00 UTC @ECMWF
 Probability that **HAIYAN** will pass within 120 km radius during the next **240 hours**
 tracks: **solid=OPER**; **dot=Ens Mean** [reported minimum central pressure (hPa) **1002**]

SUPER-TYPHOON HAIYAN, NOVEMBER 2013

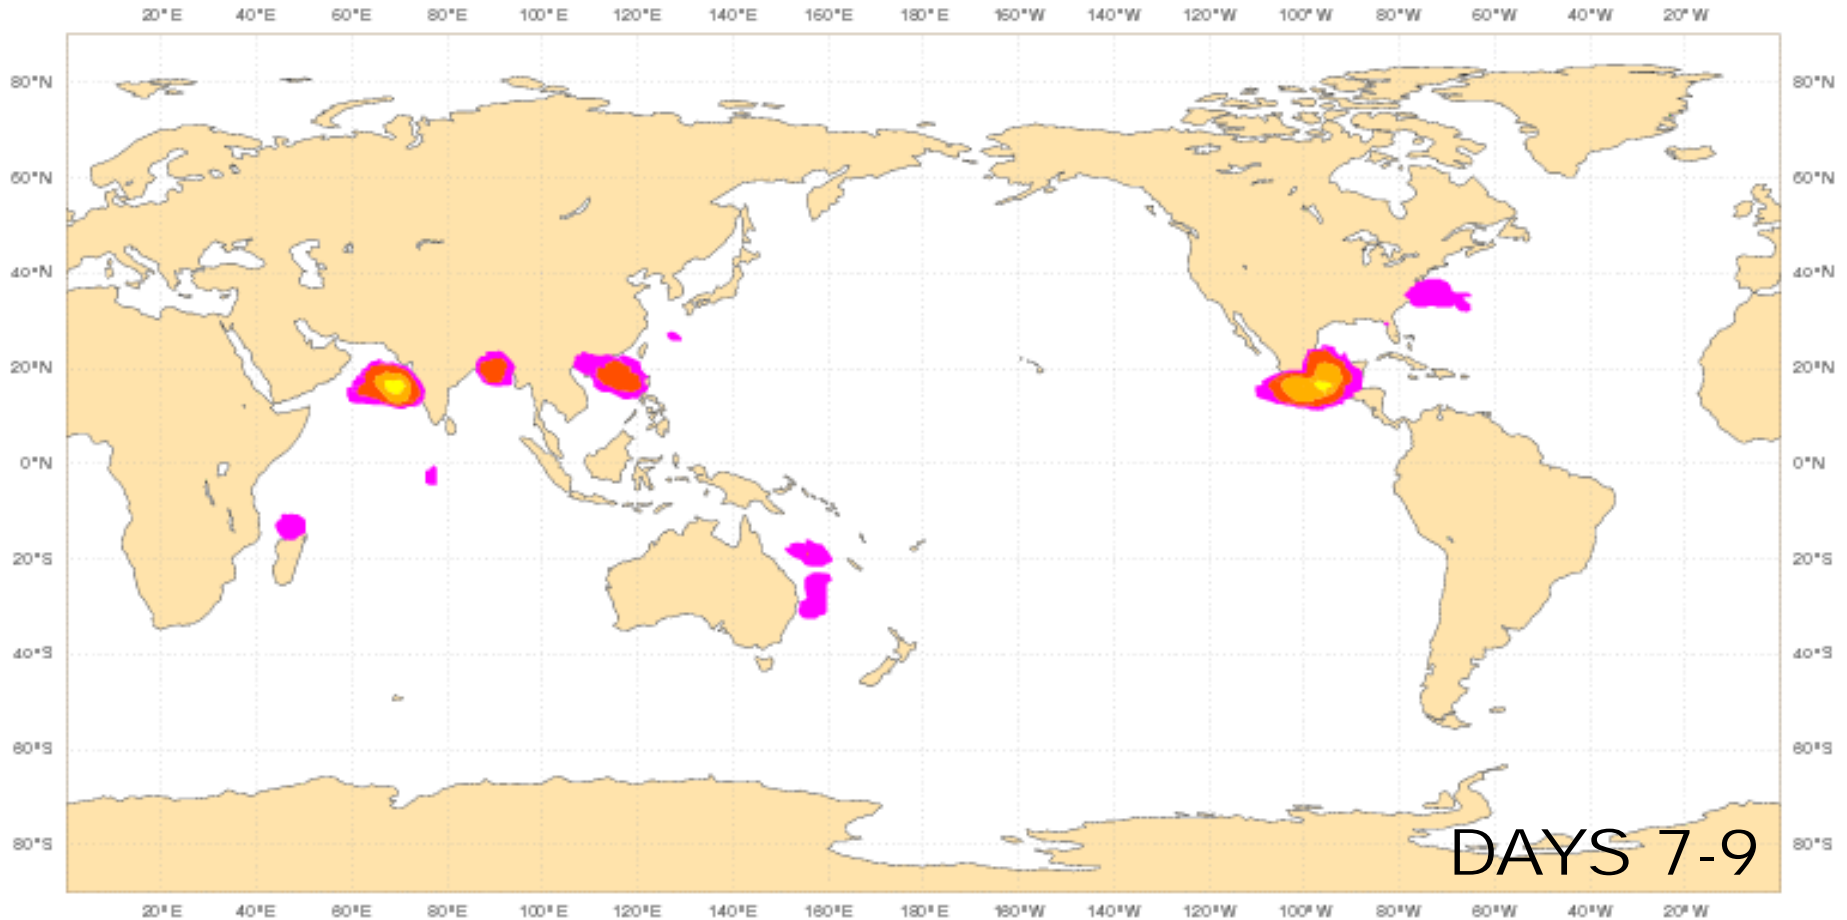

A new tracking algorithm for tropical cyclones was implemented on 1st December 2013.

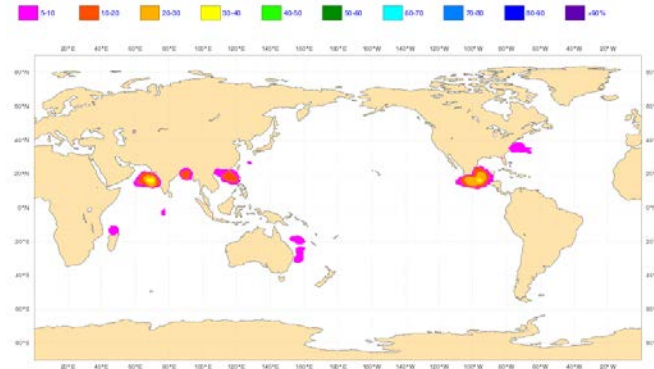

The new TC tracks are produced for **forecasts up to 240 hours** (previously to 120 hours), or until the tropical cyclone dissipates if earlier.

The tracker software is also now applied to forecast **output every 6 hours** (previously it was every 12h)

Tropical Cyclone Strike Probability Start date:Monday 02 June 2014 at 00 UTC
valid for 48hours from Monday 09 June 2014 at 00 UTC to Wednesday 11 June 2014 at 00 UTC
Probability of a Tropical Cyclone passing within 300km radius

TC tracks to BUFR format

- Are/will be disseminated in BUFR edition 4 (BUFR-4) format for ENS & HRES
- BUFR-4 tracks of tropical cyclones (TCs) for which there are bulletins at analysis time already implemented in this format (1 Dec 2013 change) (“**tracks of known TCs**”)
- BUFR-4 tracks of TCs which develop in forecasts (up to 10 days ahead) will be implemented operationally in due course (“**genesis tracks**”) – a training dataset for this will be made available in advance.
- For genesis tracks an ID number (90, 91, 92,...) is assigned to each new TC feature together with a letter to identify the basin: ‘E’-Eastern Pacific; ‘W’-Western Pacific; ‘L’-North Atlantic; ‘S’-South Indian Ocean, etc. (making eg “90E”)
- TCs with the same ID in different ENS members *are not necessarily related* (in space and time). We will not post-process to try to cross-reference new TCs between ENS members; users may choose to do this themselves.

BUFR-4 metadata = file header

5. EcCharts - New Convective Indices

- “CIN” = Convective Inhibition is being added
- “K Index” too, but not illustrated in this talk

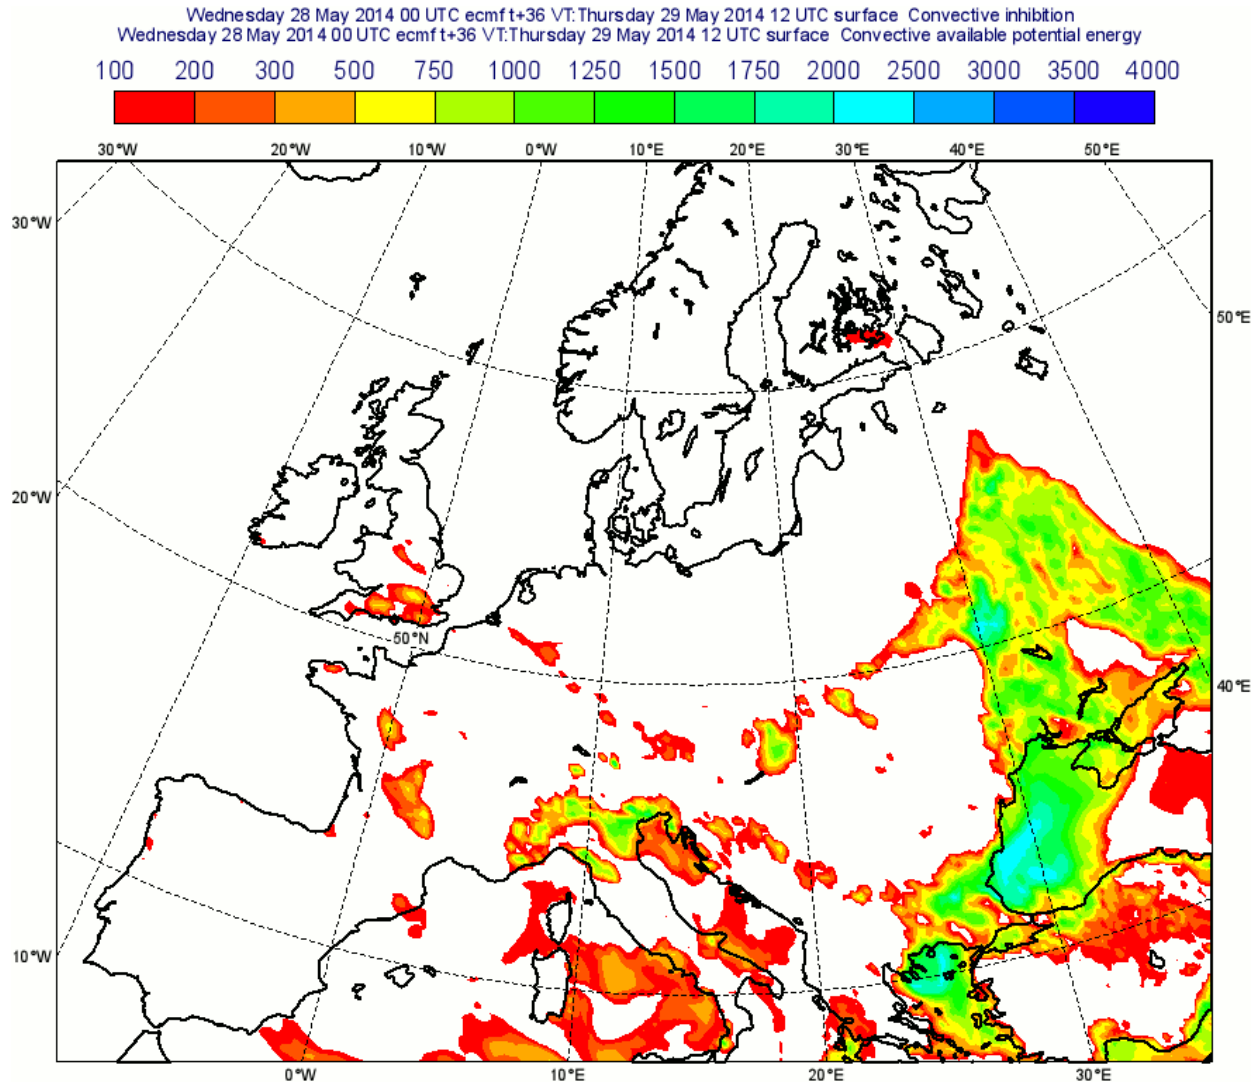

Sig convective activity usually requires **large CAPE**, & **CIN < x**

Use ecCharts as a “convection tool” ...

CAPE + CIN (convective inhibition)

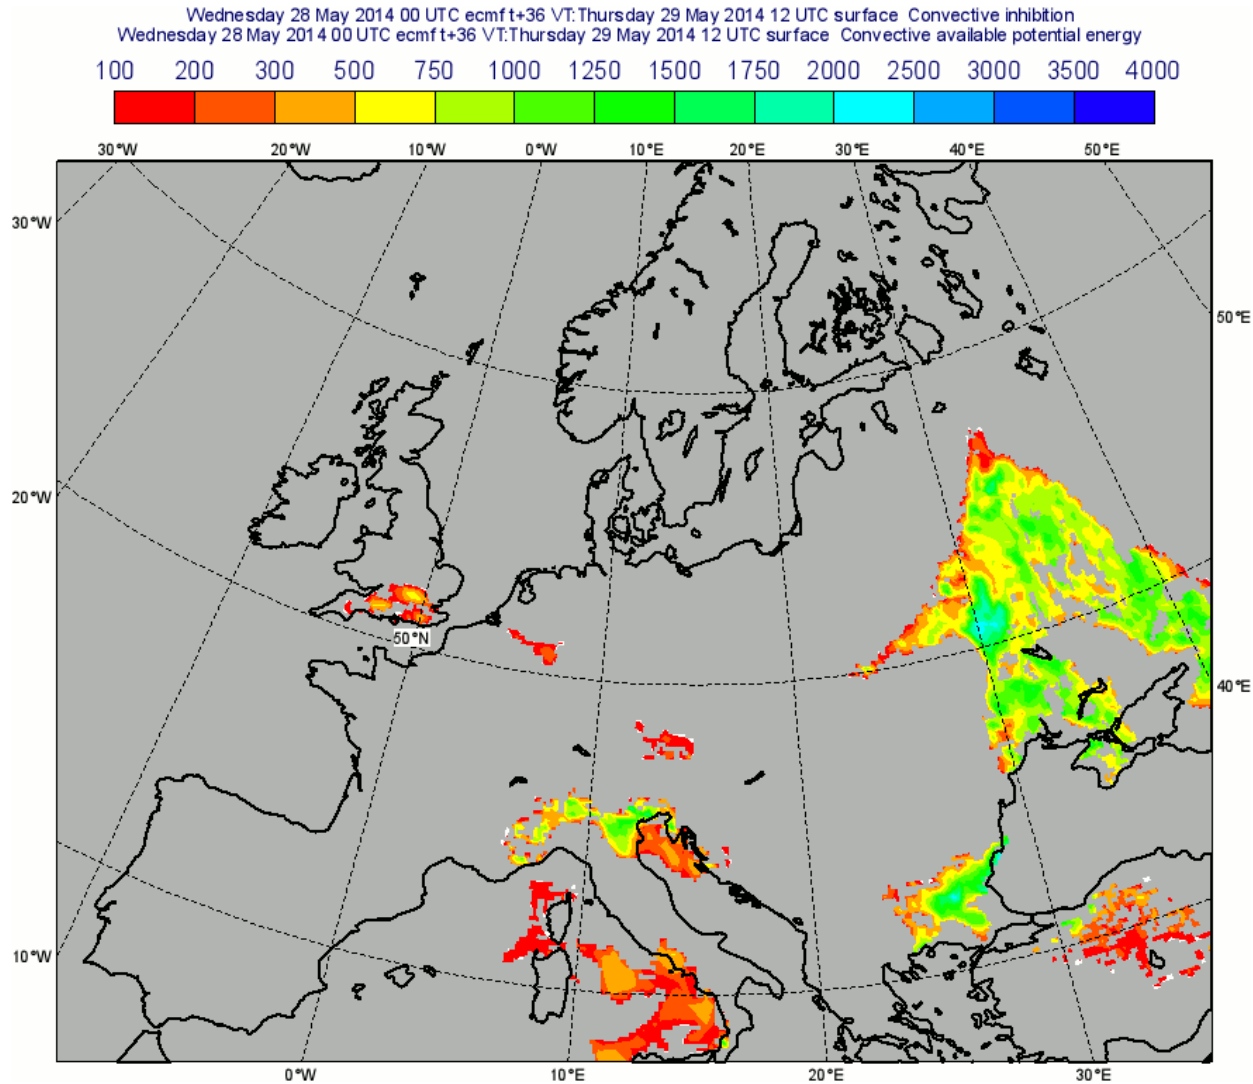

CAPE

where

CIN < ∞

CAPE + CIN (convective inhibition)

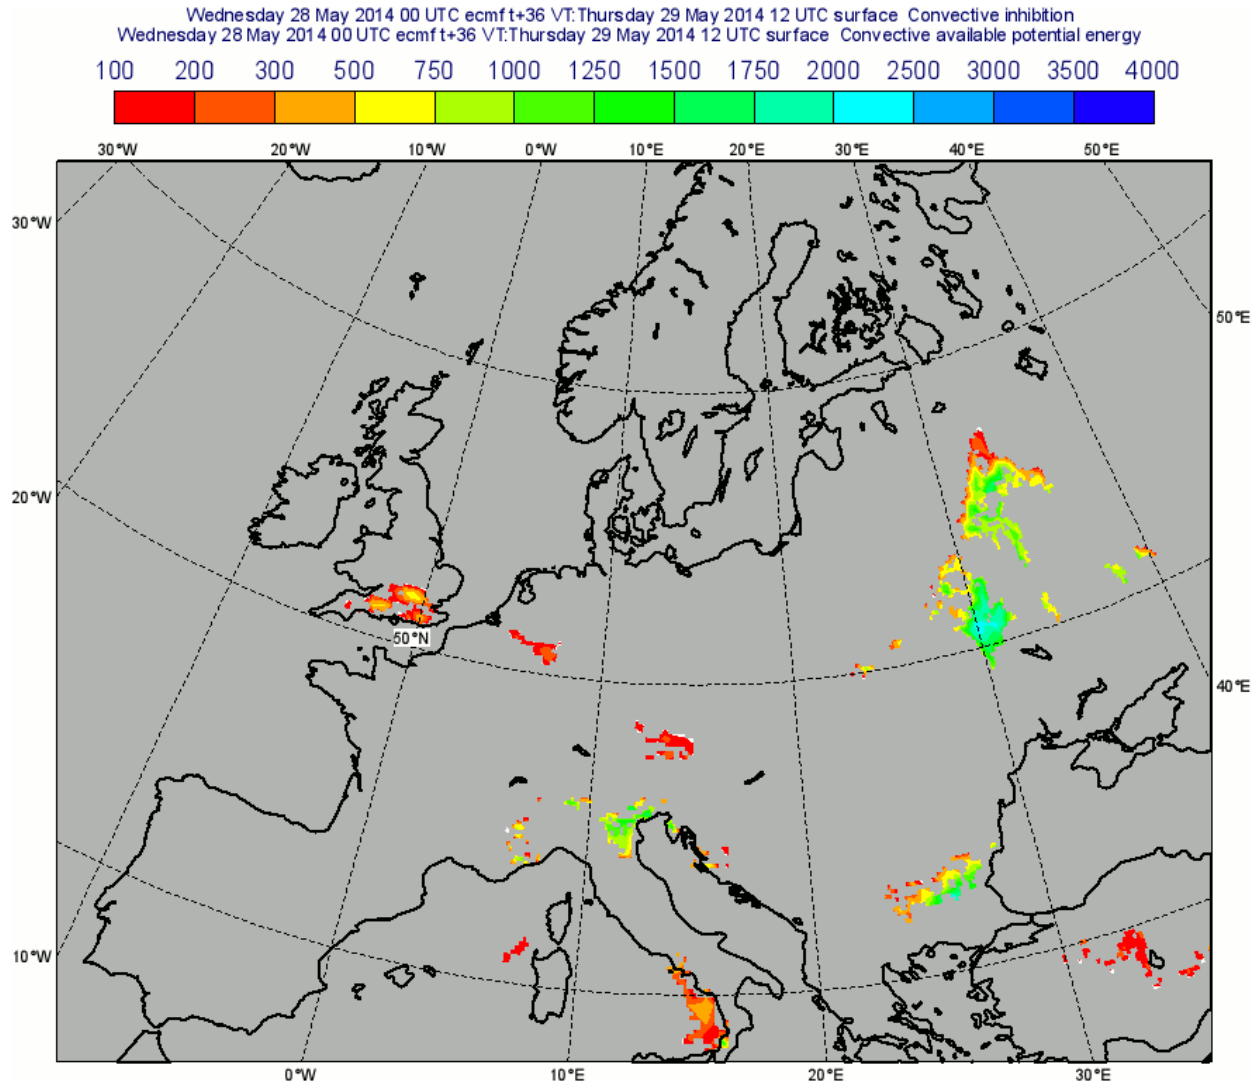

CAPE

where

$CIN < 200$
(J/kg)

CAPE + CIN (convective inhibition)

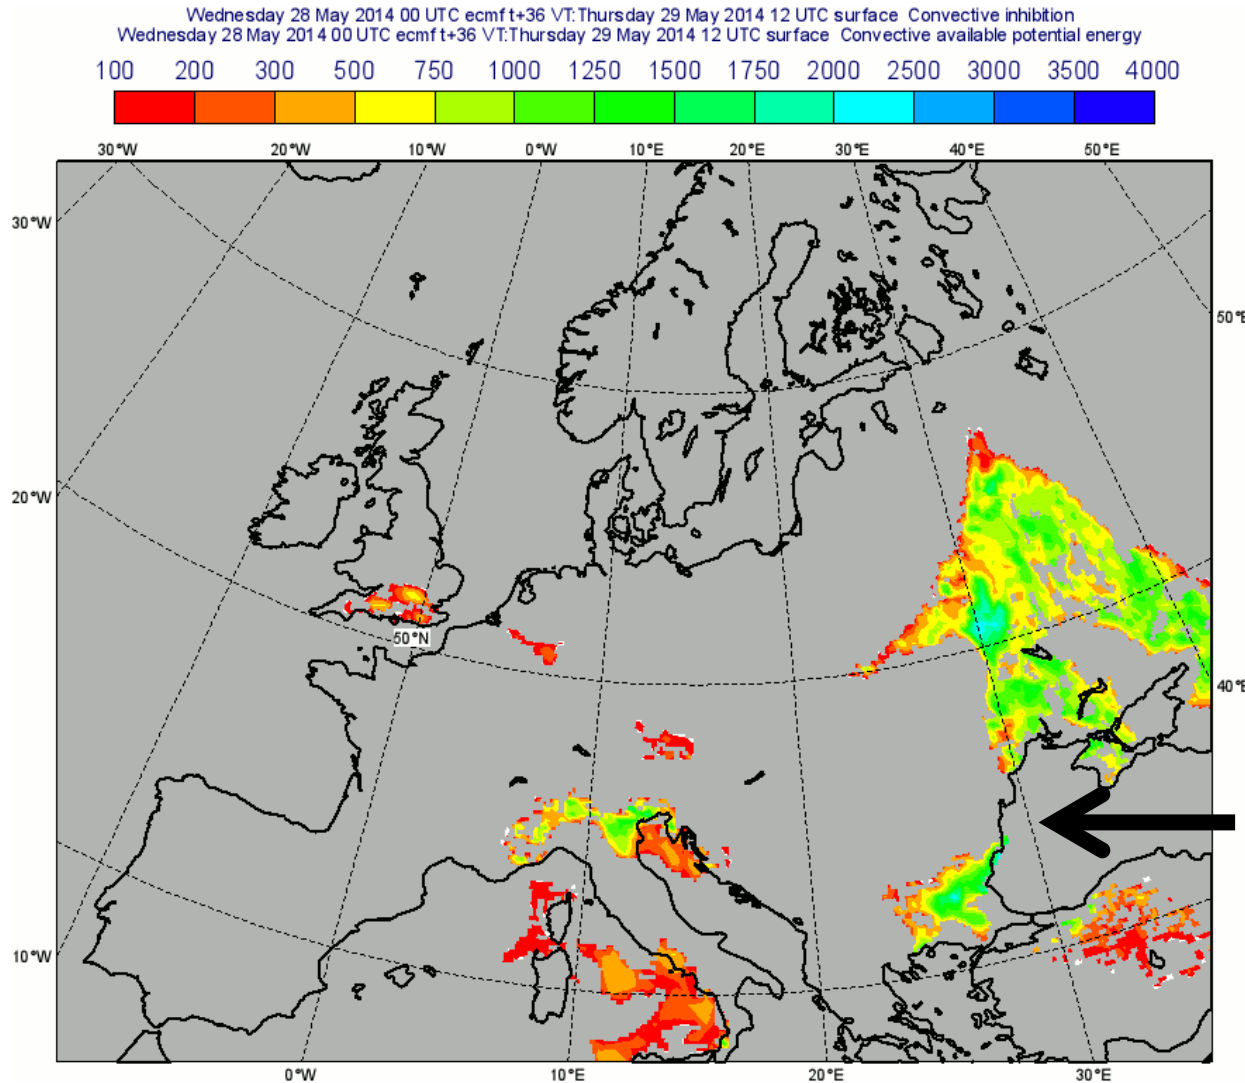

CAPE

where

CIN < 50
(J/kg)

CAPE + CIN (convective inhibition)

In the earlier CAPE
EFI example (same
case) there was no
convection here
despite large EFI and
SOT. Precluded by
large CIN.

Summary = Intro!

● 1. EFI-related developments:

- Upgraded Model Climate (M-Climate)
- Extended lead times
- New method of computation
- EFI for CAPE

● 2. Diagnosis of Freezing Rain

- Changes to model physics
- Precipitation type product

● 3. New Diagnostics

- Visibility
- Precipitation rate / type

● 4. Tropical cyclone tracks

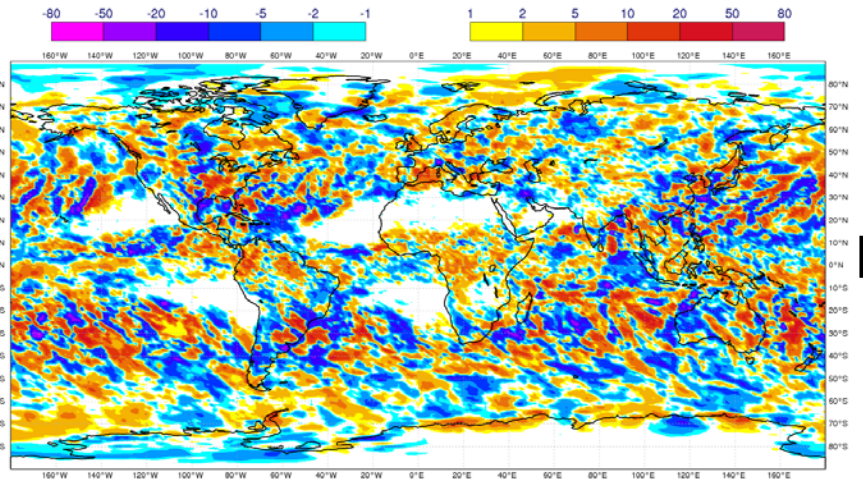

- Extension to day 10, BUFR products for genesis events

● 5. ECcharts - New Convective Indices

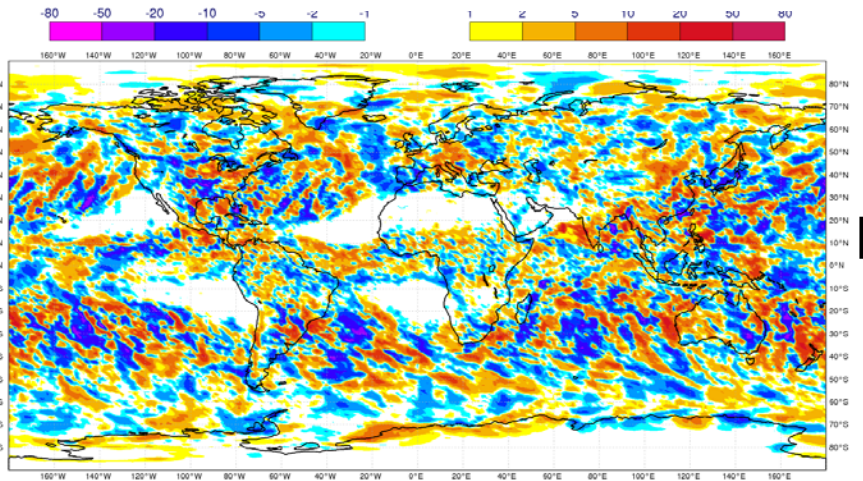

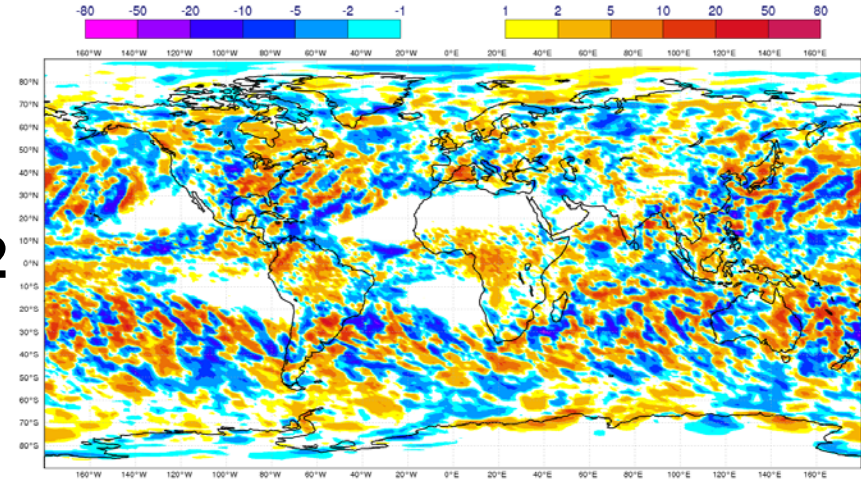

All developments to be described relate to user requests and feedback over recent years, and to ECMWF strategy in which improved prediction of severe weather is a key goal
